College presidents worry about higher ed's future

One of the major responsibilities of college and university leaders is to look into the future. This may be why alarm is growing among those in higher education that their institutions may not be sustainable over the next five years. Why? When asked about the likelihood that their institutions would be financially sustainable over the next five years, 52 percent of those queried said it was likely, 35 percent said it was possible, 12 percent said it was unlikely and 1 percent said it was impossible.

Many presidents believe that their institutions will be financially sustainable over the next five years. Yet, when asked about the likelihood that their institutions would be financially sustainable over the next five years, 52 percent of those queried said it was likely, 35 percent said it was possible, 12 percent said it was unlikely and 1 percent said it was impossible. These results show that leaders of public institutions see their institutions as more likely to be retained than leaders of private institutions.

Another very interesting result of the survey is that 71 percent of public institutions and 68 percent of private institutions believe that students will continue to enroll in college even if the cost of tuition continues to rise. This is significant because many presidents believe that the public thinks that college is less affordable than it is and that this perception is influencing the decisions of students.

These results show that leaders of public institutions see their institutions as more likely to be retained than leaders of private institutions.
