One of the oldest traditions in academia is the apprenticeship. The idea was developed in medieval times in Europe when universities began to flourish and became the primary place to learn a particular set of skills from practitioners of a particular trade. As apprentices became more specialized and, as the job market demanded more people with specific skills, the whole concept of apprenticeship evolved into what we know today as graduate programs.

Today graduate students represent an important component of higher education. As you are talking about a university or technical college, or perhaps your college, graduate students play a significant role in both teaching and research.

Despite the important roles graduate students play in academia, we rarely hear about the most important people in the system: those who teach the classes, people who support the students in their research, and those who do research. Here is a chance to discuss the debate about the best way to provide research support. The study was carried out among 4,580 students in 2010.

In the case of numerous grants, students have three major sources of financial support: the National Institutes of Health (NIH), a research fellowship from a faculty member’s grant, or direct support from their university. The way these students are funded, shapes their role and how they work. When the student is a grant from NIH, for example, she or he has a great deal of autonomy since students are primarily responsible for the output of the research. For research assistanships, they will probably be much of the time and effort invested by the mentor.

A majority of graduate students pursuing a biomedical career are supported from grants from NIH for about 21 percent of the total. Because the student is not directly supported by the university, he or she can spend the time working on his or her research and teaching assistantship.

One of the implications of this study is that we need to consider whether or not we miss out on the prep and celebrations for Tammy, the things that would have been important to her. Diane was not able to help much with treatment. Tammy’s final wish was to shave her head, but she was not able to do it.

“This is not an easy task and takes a lot of time and energy,” said Diane. “We had to do it with the help of a doctor. We had to do it with the help of a doctor.”

FELONIES
